No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosts of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET nucleic acid of expression and activity. The present sequence is a GENSET nucleic acid of
                                                                              Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of diseases, and for diagnosis of those diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 470 BP; 137 A; 87 C; 107 G; 139 T; 0 U; 0 Other;

The present invention relates to novel GENSET polynucleotides (ABZ36404-ABZ36511) encoding polypeptides (ABP75953-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity. The polynucleotides are useful for constructing or expanding chromosome maps

expression. The sense and antisense nucleic acids may also be used as DNA pobbes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of

```
The present invention relates to the isolation of human GSSP3
polypeptide, and polynucleotide sequences that encode it. The GSSP3
polypeptide reduces circulating blood glucose levels, increases insulin
sensitivity, and/or reduces body mass. The GSSP3 polypeptide and
polynucleotide sequences are useful in serum glucose regulation, fatty
acid metabolism, body weight loss, and prevention of body weight gain.
Compositions comprising GSSP3 polypeptides are useful for controlling
blood glucose levels, for treating metabolic-related diseases or
disorders (e.g. obesity, impaired glucose tolerance, insulin resistance,
chyperlipidaemias, atheroselerosis, heart disease, hypertension, stroke,
syndrome C. type I or II diabetes, diabetes related complications,
microangiopathy, retinopathy, neuropathy, nephropathy, polycystic ovarian
syndrome, ocular lesions, microangiopathic lesions, or syndromes such as
are also useful to improve physical performance during work or exercise,
and to treat dyslexia, attention-deficit disorder, attention-
                                                              useful for reducing body mass or preventing body weight gain, comprises administering composition comprising GSSP3 polypeptide.
Reducing circulating glucose levels or increasing insulin sensitivity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                schizophrenia. The present sequence encodes human GSSP3 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  deficit/hyperactivity disorder, and psychiatric disorders such as

The invention relates to an isolated polypeptide comprising CGDD1-12 (cell growth, differentiation and death), a naturally occurring amino coll growth, differentiation and death), a naturally occurring amino caid sequence at least 90% identical to CGDD, a biologically active fragment or an immunogenic fragment. Also included are the polymucleotides encoding CGDD1-12, a recombinant polymucleotide comprising a promoter sequence operably linked to the CGDD comprising a promoter sequence operably linked to the CGDD polymucleotides, a cell transformed with the recombinant polymucleotide, an anti-cGDD antibody, screening for compounds which bind to/modulate or are ant/agonists of CGDD or alter the expression of CGDD polymucleotide and accordance of CGDD polymucleotide microarray. The polypeptides, polymucleotide and a gonists and antagonists are useful for diagnosing, treating or cGDD polymucleotide microarray. The polypeptides, polymucleotide and a preventing disorders associated with aberrant expression of CGDD, particularly cell proliferative (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycythaemia ccirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycythaemia ccirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycythaemia ccirrhosis, aporiasis, primary thromobocytopaemia or cancer), developmental cycle), or autoimmune/inflammatory disorders (e.g. renal tubular aciders (e.g. infertility or a disruption in the menstrual cycle), or autoimmune/inflammatory disorders (e.g. Alzheimer disease, Parkinson's disease or cplepsy), reproductive disorders (e.g. infertility or a disruption in the hyproditis, contact dermatitis, crohn's disease, diabetes mellitus, coteoporosis, pancreatis, theumatoid arthritis, osteoporosis, pancreatis, rheumatoid arthritis, osteoporosis, pancreatis, rheumatoid arthritis, cupencedices of protein associated with CGDD. The present sequence encodes cc accorders (e.g. accorders (e.g. accorders (e.g. accorders (e.g. acco

polynucleotides and polypeptides, useful for developing a diagnostic cer or medicines for regulation of their expression and activity, or targets of gene therapy marker 88

Claim 1; Page; 222pp; English

The invention discloses a polynuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynuclectide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynuclectide, immunologically assaying the polypeptide or peptide of the polynuclectide by contacting the polypeptide or peptide of the polynuclectide by contacting the polypeptide or peptide of the polynuclectide by contacting the polypuclectide in an expressible manner and an antisense polynuclectide. The oligomuclectide is useful as a primer for synthesising the polynuclectide in an expression and an antisense polynuclectides and encoded for detecting the polynuclectide. The polynuclectides and encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or mediciones for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regenteration. Membrane proteins, signal transduction-related proteins, disease-related proteins and genes curviculation-related proteins, disease-related proteins and genes concoing them can be used as indicators for diseases (e.g. osteoporosis, the activity or expression of the encoded protein to treat diseases. The copy and activity or expression of the encoded protein to treat diseases. The copy and activity or expression of the encoded protein to treat diseases. The copy and activity or expression of the encoded protein to treat diseases. sequence presented is a cDNA of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.

New nucleic acid molecules encoding 62 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 1; Page 543-544; 716pp; English.

The invention relates to the isolation of genes (AAC69512-C69587)

checoding 62 human secreted proteins (AAB38321-B38396). The genes can be used to generate fusion proteins by linking to the gene for the human immosphobulin G FC portion (AAC69503) for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic a range of human tissues disclosed in the specification. The nucleic diagnosis, proteins, antibodies and (ant)agonists are useful in the city proteins, antibodies and (ant)agonists are useful in the city fundation of: (a) autoimmune diseases e.g. rheumatoid arthritis; (b) hyperproliferative disorders e.g. neoplasms of the breast or liver; (c) cardiovascular disorders e.g. cardiac arrest; (d) cerebrovascular disorders e.g. Alzheiner's disease; (g) infections (f) nervous system disorders e.g. Alzheiner's disease; (g) infections caused by bacteria, viruses and fungi; and (h) ocular disorders e.g. cardiac carrest corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, for expense skin aging due to sunburn, conting and epithelial cell proliferation, to prevent skin aging cell culture of conting and epithelial cell proliferation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis

```
The present invention relates to novel human secreted proteins (ABR49633-ABR496145) and their coding sequences (ACC50344-ACC50856). The proteins and their coding sequences are useful for the preparation of a diagnostic or pharmaceutical composition for diagnosing or treating a cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary arteriosclerosis and myocardial ischaemia), neural disorders, immune system disorders, muscular disorders, pulmonary disorders, renal disorders, immune cartoriferative disorders and/or cancerous diseases and conditions, for proliferative disorders and/or cancerous diseases and conditions, for conventing neural damage which occurs in neuronal disorders or infection, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or enurodegenerative conditions such as Alzheimer's diseases and Parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue transplants or bone grafts, to prevent skin aging or hair loss, to companie the market growth and differentiation of haematopoletic cells and bone marrow cells when used in combination with other cytokines, to maintain organs before transplantation or for supporting cell culture of primary tissues, to increase or decrease differentiation or proliferation of embryonic stem cells, or to modulate mammalian characteristics or metabolism. Note: The sequence data for this patent was published in continual and continual continual and continual conti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cardiant; antiarrhythmic; antiarteriosclerotic; vasotropic; cytostatic; vulnerary; antiinflammatory; nootropic; neuroprotective; antiparkinsonian; gene therapy; human; cardiovascular disorder; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human secreted proteins, useful for detecting, preventing, diagnosing, prognosticating, treating and/or ameliorating cardiovascular disorders such as arrhythmia.
                                                                                                                                            Sequence 1898 BP; 595 A; 315 C; 332 G; 654 T; 0 U; 2 Other;

protein genes, and ABP00011-ABP00299 represent the proteins they encode.

Drotein genes, and ABP00011-ABP00299 represent the proteins they encode.

ABZ71479-ABZ71540 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, the use of the secreted proteins in drug screening, and recombinant vectors and host cells comprising a nucleic acid of the invention. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, cesophagus, stomach, small intestine, large intestine, liver, biliary tract and pancreas, and include cancers of these organs and tissues. The secreted proteins and their nucleic acids may also be used in the treatment of immune disorders, inflammation, infection, treatment of immune disorders, and to promote wound healing. Nucleic acids by the invention may be used for chromosome identification, chromosome

The invention relates to isolated nucleic acid molecules ADB91065-ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB91449-ADB9144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid encoding a human secreted protein is useful in diagnosing or
mapping, in gene therapy, for identifying individuals from minute biological samples, as hybridisation probes, and as molecular weight markers. The present sequence represents a human secreted protein-encoding cDNA Clone of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Secreted protein; gene therapy; antidiabetic; diabetes; human; ss.

The invention relates to a novel human secreted polypeptide comprising a defined sequence given in the specification. The polypeptide, nucleic acid molecule, antibody, agonist or antagonist of the invention may be useful for preparing a composition for diagnosing or treating a haemopoietic or haematologic disorder such as ansemia, autoimmune disorders such as rheumatoid arthritis, inflammation, Grave's disease, diabetes, systemic lupus erythematosus or glomerulonephritis, neurodegenerative disorders including Parkinson's disease and Alzheimer's disease, wounds and hyperproliferative disorders including atherosclerosis or cancer, as well as bacterial, viral, fungal or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer or

parasitic infections. The polypeptide may also be used during gene therapy procedures and for identifying a binding partner by contacting the polypeptide with a binding partner and determining whether the binding partner increases or decreases the activity of the polypeptide. The current sequence is that of the human secreted protein-related DNA the invention.

```

polypeptide, and polynucleotide sequences that encode it. The GSSP3 polypeptide reduces circulating blood glucose levels, increases insulin sensitivity, and/or reduces body mass. The GSSP3 polypeptide and polynucleotide sequences are useful in serum glucose regulation, fatty acid metabolism, body weight loss, and prevention of body weight gain.

```
Compositions comprising GSSP3 polypeptides are useful for controlling blood glucose levels, for treating metabolic-related diseases or disorders (e.g. obesity, impaired glucose tolerance, insulin resistance, hyperlipidaemias, atherosclerosis, heart disease, hypertension, stroke, syndrome C, type I or II diabetes, diabetes related complications, microangiopathy, neuropathy, nephropathy, polycystic ovarian syndrome, ocular lessions, microangiopathic lesions, or syndromes such as acanthosis nigricans, leprechaunism and lipoatrophy). The polypeptides are also useful to improve physical performance during work or exercise, and to treat dyslexia, attention-deficit disorders such as schizophrenia. The present sequence encodes human GSSP3 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           murine; mouse; valproate; ss; multi-parameter high throughput screening; whyfis; disease signature; neuropsychiatric; neurodegenerative; schizophrenia; bipolar affective disoder; BAD; autism; Parkinson's; Alzheimer's disease; neuroleptic; nootropic; antimanic; antidepressa.

This invention relates to a novel screening method identified as a multiparameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals differential expression between those cells taken from individuals affected by that disease and those that are not affected. The present invention then describes the screening of candidate pharmaceutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, as well as Parkinson's and Alzheimer's disease. Accordingly, the compounds well as Parkinson's and Alzheimer's disease. Accordingly, the compounds not contropic, antimanic and antidepressant. Furthermore, the screening method used in MPHTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and differentially expressed in mice in the presence of a gene that is differentially expressed in mice in the presence of the therapeutic compound valproate, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 185548 BP; 58272 A; 40343 C; 37771 G; 49162 T; 0 U; 0 Other;

Fatent No. 6639063
GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Dobart, S.
APPLICANT: Glordano, J.Y.
TILLE OF INVENTION: ESTS and Encoded Human Proteins.
FILE REFERENCE: GENSET. 054PR2
CURRENT APPLICATION NUMBER: US/09/621,976
CURRENT FILING DATE: 2000-07-21
NUMBER OF SEQ ID NOS: 19335
SOFTWARE: Patent.pm
SEQ ID NO 2587
LENGTH: 560
TYPE: DNA
ONGANISM: Homo sapiens

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Published Applications NA New:*

CDNA Library Preparation: Michael J. Brownstein (NHGRI), Shiraki
CDNA Library Arrayed by: The I.M.A.G.E. Consortium (LINL)
DNA Sequencing by: Incyte Genomics, Inc.
Clone distribution: MGC Clone distribution information can be
found through the I.M.A.G.E. Consortium/LLNL at:
http://image.llnl.gov
Plate: LLAM11682 row: e column: 09
High quality sequence stop: 624.
sequence: 5'-CACGGCCATTATGGCC-3' and 3' adaptor sequence: 5'-ATTCTAGAGGCGGGCGGCGACATG-dT(30)BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.35 kb (range 0.9-4.0 kb). 14/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pBluescript Ks+); Site 1: BamHI; Site 2: Sal1-XhoI (gtcgag); Oligo-dT primed using primer average insert size 2:2 kb and normalized to ROT 5. This is a primary library enriched for full-length clones and constructed using the Cap-trapper method (Carninci, in preparation). Library constructed by M. Brownstein (NIMMI/NHGRI, wational Institutes of Health). Note: this is a NIH_MGC Library."

pSportl; Site_l: Sall; Site_2: NotI; An unidirectional
cDNA library generated from [Root apex from adult
plants]. cDNA was prepared from polyA+ mRNA using
SuperScript Plasmid System Kit (Invitrogen). The
Guble-strand cDNAs were fractionated in a sepharose
CL-2B 40cm-columns and fragments sizing between 0.8 and
1.5 Kb were directionally cloned into the vector. Details
of each source of RNA and library construction can be
obtained at http://sucest.lad.ic.unicamp.br/public"

/note="Organ: Developing inflorescence and rachis (10cm-long); Vector: pSport1; Site_1: Sal1; Site_2: NotI;
An unidirectional cDNA library generated from [Developing inflorescence and rachis (10cm-long)]. cDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their

The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity
expression. The sense and antisense nucleic acids may also be used as DNA
                probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which spatients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New GENSET polynuclectides and polypeptides, useful for treating heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, CNS, cardiovascular or gastrointestinal effects of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel GENSET polynucleotides (ABZ36404-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; antiinflammatory; nootropic; neuroprotective; cardiant; gastrointestinal; gene therapy; GENSET; heavy metal toxicity; cancer; inflammatory disease; immune disorder; neuromuscular; toxicity;

The present invention relates to novel GENSET polynucleotides (ABZ36404-ABZ36911) encoding polypeptides (ABP75953-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-teated disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New GENSET polymucleotides and polypeptides, useful for treating heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, CNS, cardiovascular or gastrointestinal effects of the

                                                                                                                                                                                                                                                                                                                                                     potentially secreted proteins. The incleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which parobes be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                            invention relates to full length GENSET human nucleic acids encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; cell growth, differentiation; death; CGDD; cancer; cell proliferative disorder; arteriosclerosis; atherosclerosis; cirrbosis; hepatitis; paroxysmal nocturnal haemoglobinuria; psoriasis; polycythaemia vera; primary thromobocytopaenia; developmental disorder; renal tubular acidosis, anaemia; mental retardation; epilepsy; AIDS; neurological disorder; Alzheimer disease; Parkinson's disease; asthma;

The invention relates to an isolated polypeptide comprising CGDD1-12 (cell growth, differentiation and death), a naturally occurring amino acid sequence at least 90% identical to CGDD, a biologically active acid sequence at least 90% identical to CGDD, a biologically active fragment or an immunogenic fragment. Also included are the polymucleotides encoding CGDD1-12, a recombinant polymucleotide or comprising a promoter sequence operably! Inked to the CGDD polymucleotides, a cell transformed with the recombinant polymucleotide, a transgenic organism comprising the recombinant polymucleotide, an anti-cCGD polymucleotides a cell transformed with the recombinant polymucleotide and active cCGDD antibody, screening for compounds which bind to/modulate or are anti-dagonists of CGDD or alter the expression of CGDD polymucleotide microarray. The polypeptides, polymucleotide and active cCGDD polymucleotide microarray. The polypeptides, polymucleotide and active cCGD antibodists are useful for diagnosing, treating or cCGDD polymucleotide microarray. The polypeptides, polymucleotides associated with aberrant expression of CGDD, particularly cell proliferative (e.g. arteriosclerosis, atherosclerosis, apericals, particularly cell proliferative (e.g. arteriosclerosis, atherosclerosis, cirrhossis, polymorial pacroysmal nocturnal haemoglobinuria, polycythaemia correction for a disorders (e.g. renal tubular acidosis, anaemia or mental retardation), neurological disorders (e.g. Alzheimer disease, parkma, autoimmune correction in the menstrual cycle), or autoimmune/inflammatory disorders (e.g. Alzheimer disease, disbetes mellitus, cortact dermatitis, crom's disease, disbetes mellitus, cortact dermatitis, crom's disease, disbetes mellitus, cortact dermatitis, crom's disease, disbetes mellitus, cortact dermatitis, fungal, parasitic, processis, proteins associated with cGDD. The present sequence cortact cortact dermatitis, fungal, parasitic, processis or helminate associated with cGDD. The present sequence cortact cortact dermatities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

polypeptide, and polymucleotide sequences that encode it. The GSSP3
polypeptide, and polymucleotide sequences that encode it. The GSSP3
polypeptide reduces circulating blood glucose levels, increases insulin
sensitivity, and/or reduces body mass. The GSSP3 polypeptide and
conjunctedide sequences are useful in serum glucose regulation, fatty
acid metabolism, body weight loss, and prevention of body weight gain.
Compositions comprising GSSP3 polypeptides are useful for controlling
blood glucose levels, for treating metabolic-related diseases or
clasorders (e.g. obssity, impaired glucose tolerance, insulin resistance,
hyperlipidaemlas, attherosclerosis, heart disease, hypertension, stroke,
cyndrome C, type I or II diabetes, diabetes related complications,
microangiopathy, retinopathy, neuropathy, nephropathy, polycystic ovarian
syndrome, ocular lesions, microangiopathic lesions, or syndromes such as
canthosis nigricans, leprechaunism and lipoatrophy). The polypeptides
are also useful to improve physical performance during work or exercise,
and to treat dyslexial, attention-deficit disorders such as
cdeficit/hyperactivity disorder, and psychiatric disorders such as
controphrenia. The present sequence represents human GSSP3 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      body mass; serum glucose regulation; body weight loss; obesity; metabolic-related disorder; impaired glucose tolerance; stroke; insulin resistance; hyperlipidaemia; atheocalerosis; heart disease; hypertension; syndrome C; type I diabetes; type II diabetes; microangiopathy; retinopathy; neuropathy; nephropathy; ocular lesion; polycygtic ovarian syndrome; acanthosis nigiran; leptechaunism; lipoatrophy; physical performance; exercise; dyslexia; schizophrenia; attention-deficit disorder; hyperactivity disorder; psychiatric disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Reducing circulating glucose levels or increasing insulin sensitivity, useful for reducing body mass or preventing body weight gain, comprises administering composition comprising GSSP3 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; GSSP3; circulating blood glucose level; insulin sensitivity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chicca J, Yen-Potin F;

Drotein genes, and ABP00011-ABP00299 represent the proteins they encode.

ABZ71479-ABZ714540 represent human secreted protein genomic fragments. The
invention also encompasses antibodies specific for the secreted proteins,

the use of the secreted proteins in drug screening, and recombinant

certains and host cells comprising a nucleic acid of the invention. The
secreted proteins, nucleic acids encoding them, antibodies or antibody

fragments specific for the secreted proteins, and modulators of protein

certivity are useful for diagnosing, treating, ameliorating or preventing
digestive disorders. Such conditions include disorders of protein

cesophagus, stomach, small intestine, large intestine, liver, biliary

tract and pancreas, and include cancers of these organs and tissues. The
secreted proteins and their nucleic acids may also be used in the

treatment of immune disorders, inflammation, infection,

hyperproliferative disorders, and to promote wound healing. Nucleic acids

of the invention may be used for chromosome identification, chromosome

mapping, in gene therapy, for identifying individuals from minute

biological samples, as hybridisation probes, and as molecular weight

anxiers.

The invention relates to isolated nucleic acid molecules ADB91065-
ADB91448 and ADB91815-ADB91911 encoding human secreted proteins ADB91449-
ADB91448 and ADB91815-ADB91911 encoding human secreted proteins ADB91449-
CADB91834. Also disclosed is a recombinant vector comprising a
polymucleotide of the invention, and a recombinant host cell comprising
the recombinant vector. The polypeptide of the invention is useful in
the recombinant vector. The polypeptide of the invention is useful in
the recombinant vector. The polypeptide of the invention is useful in
decreases activity of the polypeptide. The bolypeptide, polymucleotide,
antibody or its fragment, agonist or antagonist are useful for preparing
a pharmaceutical composition for diagnosing or treating diabetes or
conditions related to diabetes. The present sequence is that of the human
immunoglobulin Fc portion used to generate fusion proteins, increasing
the stability of the fused protein as compared to the secreted protein
conly. Note: The sequence data for this patent did not form part of the
printed specification, but was obtained in electronic format directly
from WIPO at ftp.wipo.int/pub/published_pot_sequences.

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed its a polypeptide encoded by the polynucleotide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide with the antibody of the encoded proctein, and observing the binding between the two, a transformant carrying the polypeptide or peptide with the antibody of the encoded proctein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotides and encoded proteins are useful as pharmaceutical agents and many diseaser-related proteins are useful as paramaceutical agents and many diseaser-related proteins for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The colly, and genes are concern, tumours. The colly, and second is the activity or expression of the encoded protein to treat diseases. The account of the activity or expression of the invention. Note: Some of the concern of the activity or expression of the invention. Our brained for the activity or expression of the invention. Our brained for the activity or expression of the invention. The invention relates to a novel human secreted polypeptide comprising a defined sequence given in the specification. The polypeptide, nucleic acid molecule, antibody, agonist or anisagonist of the invention may be useful for preparing a composition for diagnosing or treating a hemopoietic or haematologic disorder such as anaemia, autoimmune disorders such as rheumatold arthitis; inflammation, Grave's disease, diabetes, systemic lupus erythematosus or gloomerulonephritis, eurodegenerative disorders including Parkinson's disease and Alzheimer's atherosclerosis or cancer, as well as bacterial, viral, fungal or parasitic infections. The polypeptide may also be used during gene the polypeptide with a binding partner and determining whether the binding partner increases or decreases the activity of the polypeptide. The current sequence is that of the human secreted protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human secreted polypeptide for diagnosing, preventing or treating hematopoietic or hematologic disorders (e.g. anemia), autoimmune disorders (e.g. diabetes) or hyperproliferative disorders (e.g. cancer or atherosclerosis).
                                                                                                                                                                                                                                                                                  antianaemic; antirheumatic; antiarthritic; antiinflammatory; antithyroid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences ABB38121-B38396 represent the amino acid sequences of 62 human secreted proteins encoded by the genes AAC69512-C69587. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the ucidanosis, treatment and prevention of: (a) autoimmune disease e.g. rheumatoid arthritis; (b) hyperproliferative disorders e.g. cardiac arrest; (c) cardiovascular disorders e.g. cardiac arrest; (d) crebrovascular disorders e.g. cardiac arrest; (f) nervous system disorders e.g. cerbral inschemia; (e) andiogenesis; (f) nervous system disorders e.g. Allaheimer's disease; (g) infections caused by bacteria, viruses and fungi; and (h) ocular disorders e.g. cardiac arresting call cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis

                                                                                                                                              The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope. comprising identifying, from a particular antispen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HIV Vpu protein used in the scope of the invention.
Identifying a candidate peptide epitope, which induces a HLA class I CTL response comprises identifying variants of a peptide epitope 8-11 amino acids in length comprising primary anchor residues of the same HLA class I binding motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                a
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                          The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for Identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HLV Vpu protein used in the scope of the invention.
                                                                                                                                                                                               response comprises identifying variants of a peptide epitope 8-11 amino acids in length comprising primary anchor residues of the same HLA class I binding motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a candidate peptide epitope, which induces a HLA class I CTL response comprises identifying variants of a peptide epitope 8-11 amino acids in length comprising primary anchor residues of the same HLA class I binding motif.
                                                                                                                                                                                    Identifying a candidate peptide epitope, which induces a HLA class I CTL

XX
CC The invention relates to a method of identifying a candidate peptide comprising identifying, from a particular antigen of an CC infectious agent, variants of a peptide epitope comprising primary anchor cc residues of the same HLA class I Dinding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL CC response against variants of the peptide epitope. This sequence CC response against variants of the peptide epitope. This sequence CC represents an HLV Vpu protein used in the scope of the invention.
